30																												100	97

Directions: Look at the number running across the TOP of the chart. Find the total number of possible RIGHT answers in the exercise. Then find the number of answers you had right in the column at the LEFT of the chart. Find the place where the two lines meet. This will be your percentage of correct answers.

Example: Suppose there are 13 answers, but you have only 8 right. Find 13 across the TOP of the percentage chart. Then find 8 along the left side. Find the place where the two lines meet – 62. This would be your percentage correct.
